

Intro to HTML & CSS

Presented by Toni Gardiner

In case of emergency

Slides & files

Overview

- HTML

How markup works, basic elements, links, images, lists

- CSS

Anatomy of a CSS rule, specificity, box model

Types of styling we can apply, display and positioning

Workflow and debugging

- Build a web page

My background

- Front end developer (HTML/CSS)
- Web design, graphic design
- Art and design

Getting started

- Who has done some HTML before?
- CSS?
- Existing issue you'd like to resolve?

Questions

Please ask!

HTML

HyperText Markup Language (HTML)

The standard markup language for creating web pages and web applications.

HyperText

Text and links.

Markup Language

The good part!

Markup Language

A set of elements (aka tags) which can be applied to pieces of text to give them different meaning in a document.

It's how the computer interprets your content.

Imagine you are a computer.

You are supposed to use the following sentence on a webpage:

This is a very dangerous liquid.

**How does the computer know to give
the words ‘very dangerous’ emphasis?**

We have to tell it — mark it up!

This is a **[start strong importance]**very
dangerous**[end here please]** liquid.

This is where the language bit comes in:

This is a `very
dangerous` liquid.

gives us:

This is a **very dangerous** liquid.

Basic HTML page

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="utf-8">
  <title>Title of the page (browser tab)</title>
</head>

<body>
  <!-- Content start -->
  <p>This is a <strong>very dangerous</strong> liquid.</p>
  <!-- Content end -->
</body>

</html>
```

Let's add the paragraph above

Code speak

- **Indentation** — tabs, spaces
- **Comments** — `<!-- This is a comment (in HTML) -->`
- **Tab complete** — yay!
- Read the **docs** — these are your friends

Any others you've heard of?

Semantic

Relating to **meaning** in language or logic.

HTML elements:

Text

- **Headings** — `<h1>`, `<h2>`, `<h3>`, `<h4>`, `<h5>`, `<h6>`
- **Paragraph** — `<p>`
- **Semantics** — ``, `` (different to ``, `<i>`)
- **Line break** — `
` (self-closing)
- **Span** — `` (non-semantic)

HTML elements:

Ordered list

```
<ol>  
  <li>First place</li>  
  <li>Second place</li>  
  <li>Third place</li>  
</ol>
```

1. First place
2. Second place
3. Third place

HTML elements:

Unordered list

```
<ul>  
  <li>Oranges</li>  
  <li>Lemons</li>  
  <li>Plums</li>  
</ul>
```

- Oranges
- Lemons
- Plums

HTML elements:

Links

```
<a href="[path-to-file]">Link text</a>
```

Link text

In a sentence:

```
<p>Learn more about <a href="team.html">our team</a></p>
```

Learn more about our team

HTML elements: Links

Your site – Email link – External site

```
<a href="team.html">Page about your team</a>
```

```
<a href="mailto:toni@catalyst.net.nz">email Toni</a>
```

```
<a href="https://www.wikipedia.org">Wikipedia website</a>
```

```
<a href="https://www.wikipedia.org"  
target="_blank" rel="noopener noreferrer">Wikipedia website</a>
```

HTML elements:

Images

```

```

- Formats / .jpeg (.jpg) / .png / .gif / .svg
- Prepare image with design software
- Resolution/optimisation
- Change size/presentation with CSS

HTML elements:

Images

```

```

- Formats / .jpeg (.jpg) / .png / .gif / .svg
- Prepare image with design software
- Resolution/optimisation
- Change size/presentation with CSS

HTML elements:

Parts of a web page

- `<header>`
- `<nav>`
- `<section>`
- `<aside>`
- `<footer>`
- `<div>` (non-semantic)

The docs

developer.mozilla.org — HTML elements

CSS

Cascading Style Sheets (CSS)

A language used for describing the presentation of a document written in a markup language.

CSS

We're using it to **Style** the page

It's separate from the HTML (is its own **Sheet**)

It's **Cascading***

*We'll get to this part soon

Terracotta Warriors: Guardians of Immortality – Tickets now on sale

Get up-close to some of China's ancient imperial icons this summer. Opening Sat 15 Dec.

Link to your CSS file

In the <head> section of your HTML document:

```
<link href="css/styles.css" rel="stylesheet">
```

Note: not in the <header>!

Working with HTML

HTML

```
<p>Text</p>
```

CSS

```
p { ... }
```

A simple CSS rule

```
p {  
  color: green;  
  font-weight: bold;  
}
```

A simple CSS rule

```
p {                                /* selector */
  color: green;                    /* rule */
  font-weight: bold;              /* rule */
}
```

Let's get more specific

There are different ways of referring to a specific element or elements on the page.

In the HTML, we give elements either a **class** or an **ID** (or both!).

```
<p>Paragraph which needs different styling</p>  
<p>Paragraph which is standard</p>
```

```
<p class="intro">Paragraph which needs different styling</p>  
<p>Paragraph which is standard</p>
```

Now we can refer to the class name in the CSS

For a class, we use a period:

```
.intro {  
  font-size: 20px; /* note: default is 16px */  
}
```

A class can be used more than once

Using a class

```
<p class="intro">Paragraph which needs different styling</p>
```

To refer to a class, we use a period:

```
.intro {  
  font-size: 20px;  
}
```

A class can be used more than once

Using an ID

```
<p id="elephant-info">Elephants are big</p>
```

To refer to an ID, we use a hash:

```
#elephant-info {  
  color: green;  
}
```

An ID is unique — it can only be used once.

HTML

```
<p>Text</p>
```

```
<input id="vote">
```

```
<p class="time">Text</p>
```

```
<p class="time new">Text</p>
```

CSS

```
p { ... }
```

```
#vote { ... } /* unique */
```

```
.time { ... } /* reusable */
```

```
.time.new { ... }
```

Inheritance and specificity

The great thing about CSS is that we can stack the selectors.

Let's say we have this HTML:

```
<p>Blah blah <a href="#">first link</a> blah</p>  
<p class="fact">Blah <a href="#">second link</a> blah</p>
```

And we want to make only the second link green

Let's make a rule for that...

```
.fact a { color: green; }
```

This will only affect 'a' tags that are contained within elements that have the 'fact' class.

What happens if we also have a rule to make all the links blue?

```
a { color: blue; }
```

Most specific wins

The most specific rule will always be applied where possible

But the ordering of CSS rules **is** important

If two (or more) rules are equally specific, the lowest (bottommost) rule wins

Note:

- **Class selectors**
are more specific than element selectors
- **ID selectors**
are more specific than class selectors

What can we do with CSS?

All sorts! Here are a few things we can adjust:

- 
- Borders
 - Padding
 - Margins
 - Widths
- Rounded corners
 - Opacity
 - Font size, weight, color*
 - Background color*

*color!

Box model

Let's make the example

```
div {  
  background-color: yellow;  
  padding: 30px 40px;  
  width: 200px;  
  height: 150px;  
  border: 5px solid blue;  
  margin: 30px;  
  box-sizing: border-box; /* see note */  
}
```

* Tells browser to account for any border and padding in the values you specify for an element's width and height. This typically makes it much easier to size elements.

Shorthand options

When declaring sizes, we can:

```
margin-top: 10px;  
margin-right: 20px;  
margin-bottom: 10px;  
margin-left: 20px;
```

```
margin: 10px 20px 5px 15px; /* [top] [right] [bottom] [left] */  
margin: 10px 20px 5px;      /* [top] [right + left] [bottom] */  
margin: 10px 20px;          /* [top + bottom] [right + left] */  
margin: 20px;               /* [all values are the same] */
```

Inline, block and inline-block

Note: examples use the same HTML

Display: inline

```
<p>Text with <a href="#">link</a> <a href="#">link</a> inside</p>  
<p>Text without</p>
```

```
a {  
  display: inline; /* note: default */  
  padding-bottom: 20px;  
}
```

Text with link link inside

Text without a link

Display: block

```
a {  
  display: block; /* change */  
  padding-bottom: 20px;  
}
```

Text with

link

link

inside

Text without a link

Display: inline-block

```
a {  
  display: inline-block; /* change */  
  padding-bottom: 20px;  
}
```

Text with   inside

Text without a link

Floats

We want to 'float' this image so the text reflows around it. We can float things either to the left or the right. We need to be careful though, floated elements

don't sit in the page properly any more. Read about 'clearfix' to learn about this.

```
img { float: left; margin: 0 20px 10px 0; }
```

Pseudo selectors

```
a:hover      /* link is interacted with, but not clicked */  
a:active     /* link is being activated */  
a:visited    /* link has been visited */  
  
p:first-child /* select the first paragraph (child) */  
p:last-child  /* select the last paragraph (child) */
```

Positioning

```
static /* default */
```

```
relative
```

```
absolute
```

```
fixed
```

WLG SITES & ACTIVITIES

HOMEABOUTCONTACT

Wellington sites and activities

Your guide to the best things to see and do in the coolest little capital.

Wellington is a city where having fun is easy. You can meet meerkats, kiwis and cave trolls on the same day. Paddle on the harbour in the morning, mountain bike in the afternoon. Galleries for breakfast, museums for lunch and theatre for dinner.

Wellington Cable Car

One of Wellington's most popular tourist attractions, the Wellington Cable Car runs from downtown Wellington to the picturesque suburb of Kelburn and Wellington Botanic Garden.

[Wellington Cable Car website](#)

The Roxy Cinema

Breathing life back into one of Wellington's original suburban cinemas, Roxy Cinema is a labour of love for a group of the city's most successful film and hospitality personalities.

Extra

- Make the header and footer content line up with the main content.
- Include other HTML pages — link using nav area.
- Add Twitter logo.
- Make the web page responsive (hint: start by removing width).

Going forward

- Practise
- Content comes first
- Use docs
- Use browser developer tools (F12)
